

Magnum IEC Low Voltage Air Circuit Breakers

Product Focus

- Up to 690 Vac
- 42 kA to 100 kA I_{cu}
- 800 to 6300 Amperes
- EN 60947-2

- Proven Performance
- Expanded Capabilities
- High Withstand Ratings

Company Information

Eaton is a global leader in electrical control, power distribution, and industrial automation products and services. Through advanced product development, world-class manufacturing methods, and global engineering services and support, Eaton Electrical® provides customer-driven solutions under brand names such as Cutler-Hammer®, Durant®, Heinemann®, Holec® and MEM®, which globally serve the changing needs of the industrial, utility, light commercial, residential, and OEM markets. For more information, visit www.EatonElectrical.com.

Eaton Corporation is a global diversified industrial manufacturer with 2003 sales of \$8.1 billion that is a leader in fluid power systems; electrical power quality, distribution and control; automotive engine air management and powertrain controls for fuel economy; and intelligent systems for fuel economy and safety in trucks. Eaton has 51,000 employees and sells products to customers in more than 100 countries.

For more information, visit www.Eaton.com.

A global source for innovative electrical power distribution solutions

Proven performance ... time and again

For over 70 years, Eaton has designed, engineered and manufactured low voltage circuit breakers and trip units for the global market. Our revolutionary product developments and solutions continue to set

the standard for quality, reliability, and extended operating life. We are an industry leader in air circuit breaker technology innovations such as the first solid-state trip unit, the first microprocessor-based trip unit, zone selective interlocking, and the DE-ION® arc extinguisher design, providing superior arc quenching characteristics.

Expanded capabilities ... in less space

The advanced arc running system enables Magnum to control the arc direction, while also providing for higher interrupting capacity in a smaller space.

Increased ratings in less space provide the flexibility to design more robust electrical distribution systems capable of handling larger available fault currents, and providing better coordination with downstream devices. Magnum breakers are designed for use in low voltage assemblies: switchgear, switchboards, motor control centres, and transfer switch equipment.

Safety first

Much consideration was given to operator safety and system security.

- Improved C-loop current path design provides dramatic enhancements in both safety and efficiency.
- Higher current ratings increase the blow-on forces on the contact surfaces, allowing the proper downstream protective device to open, isolating the fault and increasing uptime.
- Positive On is indicated on the breaker faceplate. This unique interlocking feature prevents the levering door from being opened if the contacts are welded, protecting personnel from exposure to live primary contacts. Making current release prevents the breaker from closing in on a fault with peak current exceeding 25 times the RMS nominal current.
- Keyed sensor plugs ensure error-free installation of the sensor in the field.
- Deadfront faceplate isolates the operator from the primary voltage when the breaker is energized.
- Anti-pump prevents any attempts to reclose the breaker on a short circuit fault if the close signal (mechanical or electrical) is maintained.

High withstand ratings ... in a compact size

Eaton's innovations meet the needs of today's modern air circuit breakers:

- The capability to design more flexible systems that can withstand larger available fault currents.
- Better coordination with downstream devices.
- Reduced size of the switchgear assembly.
- Integrally designed breaker levering mechanism and cassette for drawout breaker with clear indication of connect, test, and disconnect positions.

Meeting the challenge

Magnum breakers are engineered specifically for use in low voltage assemblies applied at nominal voltages of 380, 415, 440, 500 and 690 Vac. Ten continuous ratings – 800 A through 6300 A – are covered with three frame sizes. Drawout and fixed mounting units are available in 3 or 4 pole designs.

Controls and indicators are conveniently grouped on the breaker's front escutcheon where they can be easily viewed and accessed through a cutout door.

High withstand ratings

Magnum provides high interruption and withstand ratings in a small physical size.

Through-the-door design

All controls, indicators, and the trip unit are visible and can be safely accessed without opening the compartment door.

Common height and depth

All three Magnum frame sizes have the same identical height and depth to facilitate standardised designs in low voltage assemblies.

Complete trip unit family

A full range of Digitrip® programmable and electronic trip units has been expanded to offer customers a choice of protection, information, and communication capabilities to meet specific requirements.

| 1 Integral arc hood. | 6 Contact status indicator (open or closed). | 12 Optional operations counter. |
| 2 Front mounted secondary contacts. | 7 Digitrip RMS trip unit. | 13 Optional "Off" key lock. |
| 3 Trip flag (optional). | 8 "Push On" to close breaker button. | 14 Integral padlockable levering device. |
| 4 Three accessory windows. | 9 "Push Off" to open breaker button. | 15 Colour-coded breaker position indicators. |
| 5 Spring status indicator (charged or discharged). | 10 Manual charging handle. | |
| | 11 Drawout cassette. | |

Rear view of integrally-designed cassette showing generous spacing for customer bus connections.

The independently operated and lockable shutter design provides a safe environment when the breaker is removed from the cassette.

A look inside the Magnum

Designed for easy access, inspection, and minimal maintenance

The stored energy mechanism, control devices, accessories, and secondary contacts are easily accessible by removing the front cover ... held in place by four captive screws. For safety, this can only be done when the breaker is in the disconnect position or removed from the cell.

The current sensor viewing window on the rear of the breaker allows for easy identification of the current sensor mounted inside.

A contact wear indicator eliminates the need for elaborate testing to determine if the contact assembly needs replacing.

Two-step stored energy mechanism for manually and electrically operated breakers

The potential energy is stored in the mechanism to close the breaker in five cycles or less. Sufficient energy to open the breaker remains available following the closing operation.

After closing, the charging spring can be recharged to provide potential energy for reclosing following a fault, providing high continuity of service. This feature allows for the following sequence:

charge – close – recharge – open – close – open.

On manually operated breakers, closing springs are charged by hand. For electrically operated breakers, springs are charged by an electric motor but can be manually charged if no power is available.

This rear view of a Magnum drawout breaker shows the designed-in safety feature of locating the primary disconnects and secondary contacts on the removable breaker element for easy and safe inspection.

Positioning of the secondary contact subassembly is dedicated for installation, maintenance, and testing. Top view shown with breaker cover removed, bottom of photo is front of breaker.

| 7 Optional "Off" key lock. | 14 Rigid frame housing. |

The right choice for low voltage assemblies ... anywhere in the world

Three structure widths offer greater capacity in less space

The Magnum has been engineered to fit into three space-saving structure widths for 3-pole and three more for 4-pole units. The Magnum breaker provides opportunities for more circuit breakers in less space. Reduced space means greater cost savings regarding assembly time, number of assembly structures, and final installation area.

Through-the-door design ensures user-friendly operation, visual indication, and optimum safety

Through-the-door design provides clear visual and physical access to the trip unit and ALL breaker controls and indicators ... including open and close buttons, the open/close indicating flag, the charging handle, breaker interlock, and the spring charge/discharge flag. Even breaker levering is accomplished with the breaker compartment door closed.

For safety and security, the breaker compartment allows three breaker positions with the door closed: connect, test, and disconnect.

Extension rails can be padlocked to prevent a breaker from being inserted into a cell, a lock-out requirement when maintenance is being performed. This helps assure personnel safety and guarantees that no one can install a breaker and energise a circuit on which a person may be working.

Through-the-window accessories

Shunt trip - Provides remote controlled circuit breaker opening when energised by a voltage input.

Spring release - Remotely closes the breaker when its coil is energised by a voltage input.

Undervoltage release (UVR) - Trips the breaker remotely when an existing voltage signal is lost or drops below an established threshold.

Internal Accessories

Auxiliary switch - Provides the capability to remotely indicate if the breaker is open or closed. Up to six N/O and six N/C auxiliary contacts are available for customer use.

Overcurrent trip switch (bell alarm) - A set of N/O and N/C contacts that indicate when a breaker trips.

Electrical operator - An electric motor, internally mounted in the circuit breaker, that charges the closing springs automatically, facilitating remote or local closing.

In the withdrawn position, the breaker can be removed from the cell on integral extension rails.

Finger-proof (IP20) secondary points with easy access for customer wiring.

All breakers can be padlocked to secure the breaker in all three positions. An optional key interlock (not shown) can also secure the breaker in each position.

The drawout breaker can be conveniently racked in or out, stopping at the various positions with the door closed.

The breaker spring charging handle is designed with sufficient space for operation even with a gloved hand.

Safety is enhanced by the through-the-door design that provides for three breaker positions with the door closed: connect, test, and disconnect.

■ Connect

■ Test

■ Disconnect

Convenient secondary contact placement facilitates wiring and maintenance

Secondary wiring points are located in the top front portion of each cell. A separate door can be used to cover the contacts so an operator can safely access them without opening the breaker compartment door. Customer contact points are dedicated to the customer's interface, totally free and isolated from factory connections.

The secondary terminals have standard finger-proof hinged covers, providing safety by protecting against accidental contact with live secondary contacts. Covers are hinged for making connections and include a small access hole for circuit testing using a probe. Each secondary contact point is dedicated to a specific function, allowing standardised wiring diagrams and true electrical interchangeability of common size breakers. Standard wiring points help improve quality while reducing maintenance and inspection time for end customers.

A common family of accessories for all frame sizes

We designed Magnum accessories to fit all frame sizes, thus reducing inventory parts and the possible confusion that can exist when various accessory sizes are required for individual breaker frames.

Magnum through-the-window accessories are installed in the right front of the breaker. The unique windows in the breaker cover enable accessories to be quickly identified by name and rating. Additional internal accessories include an auxiliary switch, over-current trip switch (alarm), and electrical motor operator.

Accessories are plug-in units that snap in place, providing for easy mounting and wiring to save both installation time and cost. This feature facilitates accessory changes by the installer or user personnel, eliminating the need for manufacturer modification or outside service companies.

Modular accessories are keyed for fast error-free mounting in the field. For example, the spring release unit can only be mounted in the centre cavity.

Magnum modular design allows customers to mount accessories in the field.

Viewable through-the-window electrical accessories are identically sized, yet keyed for error-free mounting.

The auxiliary switch is an internal accessory that provides remote electrical indication of the breaker status.

An electric motor automatically charges the closing springs. In absence of control power, the springs can be manually charged.

The trip unit family

Protection and information ... the digitrip family provides choices like no other

Ever since introducing the first microprocessor-based trip unit, Eaton has advanced the technology into a more complete family of Digitrip RMS Electronic and Programmable Trip Units designed and engineered exclusively for Magnum breakers. Magnum can also be supplied as a non-automatic switch.

Electronic trip units

- Digitrip RMS 220 provides long time and instantaneous protection only.
- Digitrip RMS 520i enables the user as many as nine phases and earth current protection settings for maximum flexibility in trip-curve shaping and multi-unit coordination, and adds earth fault current protection settings.
- Digitrip RMS 520Mi adds phase, neutral, and Earth fault current metering ... with a four-character LCD display window.
- Digitrip RMS 520MCi has the same features as the 520Mi, but also includes communications.

Programmable trip units

Digitrip RMS 1150i provides programmability for more sophisticated distribution systems including:

- Increased protection and coordination capabilities.
- Systems monitoring information including power factor, voltage current, harmonic distortion, values, and waveform capture with a three-line (8 characters per line) LED display.
- Two programmable contacts for customer use.
- Time stamping of trip events for improved troubleshooting and diagnostics.
- Accuracy of 1% on metered values and 2% on energy and power.
- Systems diagnostic information.
- INCOM and PowerNet communications.
- Allows for custom curve shaping or selectable IEC curves.

	~	~	~	~	110	110	~	~	217	217

¹⁾ Circuit breakers equipped with integral trip units have a making current release set to trip instantaneously at 25 x I_n peak current to prevent closing on a fault current exceeding that magnitude.

²⁾ Magnum ACB's carry an IT rating at 440 Vac per EN 60947-2 Annex H. Contact Eaton for 690 Vac IT applications.

³⁾ The I_{cw} 1 sec/3 sec rating is 50/30 kA for 2000 A MWN 50 kA breaker.

⁴⁾ Standard frame circuit breakers rated 100 kA are equipped with a high instantaneous trip set to protect above 85 kA_{rms}. I_{cu} is 100 kA and I_{cs} is 85 kA at 440 Vac. I_{cu} and I_{cs} are 85 kA at 690 Vac.

⁵⁾ The approximate weights and dimensions shown are based on horizontal terminals.

⁶⁾ Close and latch ratings are applicable only to non-automatic switches. Non-automatic switches should be applied with a suitable external overcurrent device with instantaneous trip to protect above the published close and latch rating.

⁷⁾ The maximum available instantaneous interrupting rating for the standard frame non-automatic switch is 85 kA.

Dimensions (mm)

Magnum air circuit breakers have common heights and depths to facilitate standardized designs in low voltage panel systems.
